ABSTRACT
The antimicrobial zest of hydro-alcoholic and methanolic seed extracts of Datura fastuosa L. was evaluated against three clinical bacterial strains (Escherichia coli, Staphylococcus aureus and Bacillus subtilis) and two clinical fungal strains (Candida albicans and Aspergillus niger) by tube dilution method. Both the plant extracts were found to be active against the tested micro-organisms. The methanolic extract of D. fastuosa was found to inhibit bacterial strain, E. coli effectively with minimum bactericidal concentration (MBC) of 25 µg/mL. The hydro-alcoholic extract of D. fastuosa seeds was found to be more potent in terms of its bactericidal concentration for S. aureus with both minimum inhibitory concentration (MIC) and MBC values as 25 µg/mL. Also, methanolic extract was found to be more efficient in inhibiting S. aureus having MIC 12.5 µg/mL. Hydro alcoholic and methanolic seed extracts of D. fastuosa were also evaluated for antioxidant potential using 1,1-diphenyl-2-picryl-hydrazyl radical scavenging assay, total antioxidant capacity, total amount of phenolic content, total flavonoid content, total flavonols and total proanthocyanidines content. The IC50 value using DPPH model for methanolic extract of D. fastuosa was found to be 28.34 µg/mL & for hydro-alcoholic extract, 25.78 µg/mL. The observed values for total antioxidant capacity, total amount of phenolic content, total flavonoid content, total flavonols and total proanthocyanidines content for methanolic extract of D. fastuosa were found to be 6.83 mg/g, 9.97 mg/g, 6.34 mg/g, 5.37 mg/g and 1.42 mg/g of plant extract respectively and for hydro-alcoholic extract, the values for the same parameters were 7.44 mg/g, 6.88 mg/g, 9.35 mg/g, 5.36 mg/g and 0.88 mg/g respectively.

KEYWORDS: Antimicrobial, antifungal, antioxidant, Datura fastuosa L.

INTRODUCTION
Medicinal plants are used for the ailment of several microbial and non-microbial originated diseases due to their valuable effects in health care. The reliability, availability and lower side effect of medicinal plants in therapeutic use has made them popular and acceptable in medical health care all over the world. Several plants have therapeutic and pharmacological effects for antimicrobial, antioxidant, anti-infectious and antitumour activities. 1, 2 Active chemical constituents from medicinal plant has been most widely used as primary health care in many countries. 3

Datura fastuosa Linn, also known as D. metel or D. alba Nees (Solanaceae) is a Nigerian medicinal plant mostly used in phytomedicine, particularly the leaves and seeds are used as anesthetic, anodyne, anti-asthmatic, anti-pasmadic, antimicrobial, anti-tussive, bronchodilator, and hallucinogenic. 4

As per the reported literature, antimicrobial activity of ethyl acetate and methanol extracts of D. metel plant was investigated by agar disc and well-diffusion method against HIV associated opportunistic infections. The plant extracts showed better inhibitory activity against the tested organisms. 5 Potential antibacterial activity of various parts of D. innoxia were examined by preparing their crude aqueous and organic extracts against gram negative bacteria (E. coli and S. typhi) and gram positive bacteria (B. cereus, B. subtilis and S. aureus). 6

In a study, D. metel leaf extracts significantly reduced the in vitro growth of Rhizoctonia solani and Xanthomonas oryza pv. Oryzae. The methanolic extract showed the best control of the pathogens recording 10–35% more toxicity than aqueous extract. Foliar application of leaf extracts effectively reduced the incidence of sheath blight and bacterial blight diseases of rice under green house condition. 7

The antibacterial activity of methanolic and hexane leaf extracts of D. stramonium, Ricinus communis, Calotropis gigantean, Malva verticillata and Malvastrum coromandelium was evaluated against E. coli, S. aureus and B. subtilis by agar well diffusion method. The maximum antimicrobial activity expressed in terms of zone of inhibition was shown by methanolic and hexane leaf extracts of D. stramonium followed by Ricinus communis, Calotropis gigantean and Malva verticillata against the tested organisms. This study also revealed that methanolic leaf extract was more effective than hexane extracts in term of their antibacterial potential. 8

The antibacterial activity of the methanol extracts of the aerial parts of the D. innoxia and D. stramonium was investigated and the extracts showed activity against gram (+) bacteria in a dose dependent manner. 9

The antinmycotic potential of D. metel was also investigated in vitro against Ascochyta rabiei, the cause of chickpea blight disease. The pathogen was exposed to various n-hexane concentrations (1, 2, 3 and 4% w/v) of shoot and root extracts of D. metel using poisoning food technique. All the tested concentrations of both root and shoot extracts inhibited the growth of the target fungal pathogen. 10

A novel compound 2-(3,4-dimethyl-2,5-dihydro-1H-pyrrol-2-yl)-1-methylthyl pentanoate was isolated from the plant D. metel L. The in vitro activity of this dihydropyrorole derivative against Aspergillus and Candida species was evaluated by using standard methods approved by the National Committee for Clinical Laboratory Standards. The compound was found to be active against all the species tested, namely C. albicans, C. tropicalis, A. fumigatus, A. flavus and A. niger. 11
A steroidal compound, withametelin, isolated from D. metel leaves showed antifungal activity against some plant pathogenic and saprophytic fungi. Antioxidant potential was found to be higher in D. metel leaf than bark. The aqueous extract of D. metel leaf and stem bark showed antioxidant effect of 48.80% and 23.82% respectively, while the ethanol extract showed 25.51% and 3.41%.

**MATERIALS AND METHODS**

**Chemical and Reagents Used**

Sodium chloride, glucose, peptone, yeast, agar, dimethyl sulfoxide (DMSO), methanol, ascorbic acid, potassium ferricyanide, phosphate buffer, DPPH, ferric chloride, o-phenanthroline, ethanol, FC (Folin Ciocalteau) reagent, gallic acid, sodium phosphate, ammonium molybdate, aluminium trichloride, sodium acetate, quercetin, vanillin. All the chemical and reagents used in the present study were of analytical grade.

**Extraction of Datura fastuosa Seeds**

The plant seeds were air dried for 3 weeks and then ground to coarse powder using a mechanical grinder. The powder obtained was extracted with methanol and water:ethanol (1:1) separately at room temperature (25±2°C). The crude plant extracts were obtained by using Soxhlation. The obtained semi-dried crude extracts were labelled appropriately as ME (methanol extract) and HAE (hydroalcoholic extract) and kept in desiccator for further use.

**Microorganism collection**

The bacterial and fungal strains selected for present study were obtained from Department of Microbiology, Guru Jambeshwar University, Hisar, India. A total of three bacterial strains namely *Escherichia coli*, *Bacillus subtilis* and *Staphylococcus aureus* & two fungi namely *Candida albicans* and *Aspergillus niger* were screened for antimicrobial zest. These bacterial cultures were maintained in nutrient agar slants at 37°C. The microorganisms were reactivated prior to susceptibility testing by transferring them into a separate test tube containing nutrient broth and incubated overnight at 37°C.

**Media preparation**

Double strength nutrient media used for antibacterial studies was prepared using peptone (1g), yeast (0.3g), sodium chloride (0.5g) and dissolving these ingredients in water q.s. to make 50 ml. The media was then sterilized by autoclaving at 15 lb/psi pressure for 15 min. Double strength Sabouraud's glucose broth used for antifungal studies was prepared by dissolving glucose (8g), peptone (2g) in distilled water q.s. to make 100 ml with aid of heating. Then the medium was cooled and filtered, pH was adjusted to 5.4 with 10% lactic acid. The media was sterilized by autoclaving at 15 lb/psi pressure for 15 min. Minimum inhibitory concentration (MIC), minimum bactericidal concentration (MBC) and minimum fungicidal concentration (MFC).

**Antioxidant potential**

Determination of antioxidant potential was done using DPPH radical scavenging assay. Prepared 300 μl drug extract, added 1 ml Folin Ciocalteu's reagent (FC reagent) and 5 ml sodium carbonate (20%). Final volume was made up to 10 ml with distilled water and absorbance was taken at 735 nm. Same procedure was followed for its standard gallic acid. Percentage inhibition and IC$_{50}$ were calculated using the formulae.

\[
IC_{50} = \frac{a \pm b (50)}{\sum x y - \bar{y} \sum x}
\]

where $a$= intercept on the line  
$b$= regression coefficient of $x$ on $y$  
$x$= concentration in μg/ml  
$y$= % scavenging

**In vitro antioxidant studies**

Different concentrations of both methanolic and hydroalcoholic extracts of *D. fastuosa* seeds were prepared and tested against clinical bacterial isolates and pathogenic and saprophytic fungi. The extract was serially diluted to give a concentration of 50, 25, 12.5, 6.25, 3.125, 1.56 and 0.78 μg/ml. In all the test tubes, 0.1 ml of suspension of bacteria in saline was added and incubated at 37°C for 24 h (for plates containing bacterial cultures), 37°C for two days (for plates containing *Candida albicans* culture) and 25°C for seven days (for plates containing *Aspergillus niger* culture). A tube containing nutrient broth only was seeded with the test organism to serve as control. All the tubes were then incubated at 37°C for 24 h and then examined for growth by observing turbidity. The minimum bactericidal concentration (MBC) of the plant extract on the clinical bacterial isolates was carried by pipetting out 0.1 ml bacterial culture from the mixture obtained in the determination of MIC tubes which did not show any growth and sub cultured on to nutrient media and incubated at 37°C for 24 h. After incubation the concentration at which there was no single colony of bacteria was taken as MBC. MFC was also determined similar to MBC.

**Chemical and Reagents Used**

Sodium chloride, glucose, peptone, yeast, agar, dimethyl sulfoxide (DMSO), methanol, ascorbic acid, potassium ferricyanide, phosphate buffer, DPPH, ferric chloride, o-phenanthroline, ethanol, FC (Folin Ciocalteau) reagent, gallic acid, sodium phosphate, ammonium molybdate, aluminium trichloride, sodium acetate, quercetin, vanillin. All the chemical and reagents used in the present study were of analytical grade.

**Extraction of Datura Fastuosa Seeds**

The plant seeds were air dried for 3 weeks and then ground to coarse powder using a mechanical grinder. The powder obtained was extracted with methanol and water:ethanol (1:1) separately at room temperature (25±2°C). The crude plant extracts were obtained by using Soxhlation. The obtained semi-dried crude extracts were labelled appropriately as ME (methanol extract) and HAE (hydroalcoholic extract) and kept in desiccator for further use.

After incubation the concentration at which there was no single colony of bacteria was taken as MBC. MFC was also determined similar to MBC.
Anju Dhiman et al: Antimicrobial and In vitro Antioxidant zest of Datura fastuosa L. seeds

5. **Total flavonols**: To 2 ml of 1000 μg/ml drug extract, 2 ml AlCl₃ (2% in ethanol) and 3 ml sodium acetate (50 g/l) was added. After 2.5 h, absorbance was taken at 440 nm. Same procedure was followed for standard, quercetin.¹⁹

6. **Total pro-anthocyanidines content**: To 0.5 ml of 0.1 mg/ml extract solution, 3 ml of 4% vanillin methanol was added. 1.5 ml of HCl was added, allowed to stand for 15 min and absorbance was taken at 500 nm.²⁰

**RESULT AND DISCUSSION**

**Antimicrobial activity**

In the present investigation, results showed that both methanolic and hydroalcoholic extract of *D. fastuosa* inhibited the growth of bacteria *S. aureus, E. coli, B. subtilis,* and the fungus *C. albicans* and *A. niger* by tubidimetric method.

It was found that both methanolic and hydroalcoholic extracts of *D. fastuosa* exhibited antimicrobial activity against tested microbial strains. However, hydroalcoholic extract of *D. fastuosa* seeds was found to be more potent in terms of its bactericidal concentration for *B. subtilis*, when compared with methanolic extract. Also, methanolic extract was found to be more efficient in inhibiting the *S. aureus*, than hydroalcoholic extract (Table 1, 2).

Antioxidant Activity

Ten different concentrations of test extracts (methanolic and hydroalcoholic), ranging from 2-1000 μg/ml were prepared and tested for their anti-oxidant activity in different in-vitro models. It was observed that free radicals were scavenged by the tested compounds in a concentration dependent manner up to the given concentration in DPPH and iron chelating models. The half maximal inhibitory concentration (IC50) of methanolic extract of D. fastuosa by DPPH assay was found to be 28.34 μg/ml & for hydroalcoholic extract 25.78 μg/ml.

Total Antioxidant Capacity: The antioxidant activity of methanolic and hydroalcoholic extracts of D. fastuosa at 2, 4, 8, 16, 32, 64, 128, 226, 512, 1000 μg/ml concentrations was measured by phosphorous-molybdenum method. It was calculated using the standard curve of ascorbic acid (y = 0.007x - 0.1751; R² = 0.9811) (Fig.3) and expressed as number of equivalent of ascorbic acid per gram of plant extract. The total antioxidant capacity of methanolic and hydroalcoholic extract was found to be 6.83 mg/g and 7.44 mg/g of plant extract respectively (expressed as ascorbic acid equivalents).

Total flavonoid content: Total flavonoid contents of both methanolic and hydroalcoholic extracts were calculated (mg/g) using the standard curve of gallic acid from equation (y = 0.001x+0.005, R² = 0.999, where y was the absorbance and x, concentration as shown in Fig 4. Total flavonoid contents of methanolic and hydroalcoholic extract is shown in Table 3.

Total Phenolic Content: Total phenolic content of both methanolic and hydroalcoholic extracts were calculated (mg/g) using the standard curve of gallic acid from regression equation (y = 0.013x +0.127, R² = 0.988) where y was the absorbance and x (concentration) as shown in Fig 5. Total phenolic content of both methanolic and hydroalcoholic extracts is shown in Table 3.

Total flavonol Content: Total flavonol content of both methanolic and hydroalcoholic extracts were calculated (mg/g) using the standard curve of quercetin from regression equation (y = 0.060x +0.000, R² = 0.999) where y was the absorbance and x, concentration as shown in Fig 6. Total flavonol content of both methanolic and hydroalcoholic extracts is shown in Table 3.
Total pro-anthocyanidine content: Total pro-anthocyanidine content of both methanolic and hydroalcoholic extracts were calculated (mg/g) using the standard curve of catechin from equation ($y = 0.5825x$, $R^2 = 0.9277$). [20] Total pro-anthocyanidine content of both methanolic and hydroalcoholic extracts is shown in Table 3.

CONCLUSION
There has been increasing interest in the development of new types of effective and nontoxic antimicrobial compounds. As the rapid emergence of drug-resistant organisms necessitates the continuous search of new antimicrobial substances, natural products may act as alternative for antibiotics and chemotherapeutic agents in certain circumstances. Based on our studies, *D. fastuosa* seeds showed strong in vitro free radical scavenging effect in cell free system. However, phytochemical research is still required to identify the active principles responsible for the biological activity of this medicinal plant.
