The most common bacteria responsible for acne is *Propionibacterium acnes* but some studies report that *Staphylococcus aureus* are also found in acne patients. The *P. acnes* colonize the follicular duct and proliferates, which results in the conversion of sebum into triglycerides which are probably responsible for development of inflammation. The use of natural remedies as well as herbal medication in practice since thousand years. With minor side-effects and much advantages of multi functionality, the herbal medicines are being used in different formulation to cure many diseases. The aim of the study is:

- Formulation development of anti acne cream
- Evaluation of anti acne cream

MATERIALS AND METHOD

**Plant Materials**

Roots of Asgand nagori (*Withania somnifera*), Roghan Aneesi (oil), Kushta zast (zinc oxide bhasm), Roghan Laung (oil) were obtained from Hamdared (WAKF) Laboratories. The microorganism *Propionibacterium acnes* obtained from microbial cell laboratory and gene bank, Chandigarh, India.

**Chemicals**

All chemicals used were of analytical grade and is obtained from standard chemicals, New Delhi, India.

**Apparatus**

- Fourier transform Infra red Spectroscopy, Ultraviolet Visible Spectrophotometer, Differential scanning calorimeter, Dissolution Apparatus USP I.

**Physico chemical analysis of Withania somnifera**

**Total Ash Value**

Heat silica crucible to red heat for 30 minutes, allow cooling and weighing it. Unless otherwise specified in the individual monograph weigh accurately about 1 g substance under examination and evenly distribute it in crucible. Dry at 100o to 105o for 1 h and ignite to Constant weight. Allow to cool after each ignition. The material should not catch fire at any time during procedure.
after prolong ignition carbon free ash cannot be obtained as directed in method. Calculate the % wt of ash on dried basis. \(^5\)

**Acid Insoluble Ash**

Boil the ash (Total ash method) with 25 ml of hydrochloric acid for 5 minutes, collect the insoluble matter in ash less filter paper (Whatmann Filter paper), wash with hot water, ignite, cool and weigh. Calculate the percentage of acid insoluble ash on dried basis. \(^6\)

**Moisture content (LOD)**

5 g of powder were weighed accurately in petridish and kept in hot air oven maintained at 110°C for 4 h. After cooling in dessicator loss in weight was recorded after every hour. The procedure was repeated till constant weight was obtained. \(^7\)

**Analytical Methodology of Withania somnifera Extract in Phosphate Buffer**

**UV Spectroscopy**

Stock solution of powdered drug was prepared by dissolving 10 g of drug in phosphate buffer (6.8pH). Required dilutions of 1 ppm, 2 ppm, etc were prepared. The prepared dilutions were scanned in the UV region of 225 nm.

**Fourier Transform Infrared Spectroscopy (FT-IR)**

FTIR was obtained using a Shimadzu FTIR spectrophotometer, model Iraffinity- 1CE. In order to collect the spectra powdered drug was taken and its KBr pellets were prepared. It was analyzed from 500 to 4000 cm\(^{-1}\) range. \(^8\)

**Differential Scanning Calorimetry**

DSC of the pure drug was taken by using differential scanning calorimeter (Perkin-Elmer DSC- 7) calibrated with indium. All samples were run in triplicate. The instrument was adjusted to the following parameters: \(^9\)

- **Atmosphere:** Nitrogen inert.
- **Heating rate:** 10°C/min
- **Gas flow rate:** 20 ml/min
- **Temperature range:** 0-300°C
- **Sample size:** 0.5 mg

**Formulation Development of Cream Base**

Oil phase and water phase were taken in separate beakers and heated upto70°C. Oil phase was added in water phase with continuous stirring till oil in water emulsion was prepared. \(^10\)

**Formulation Development of Anti acne Cream**

In small amount of base sulphurated potash was added and mixed well using mortar and pestle, to it roghan aneesi and roghan laung was added. In other part of base asgand extract was mixed and to it zinc oxide and kushtha zast were added and khushbho rose were added and mixed well. Both part were mixed together and glycerine was added and triturated well. \(^11\)

**Evaluation Parameter of Cream**

**pH**

About 20 mg of the formulation was taken in beaker and subjected to pH measurement using digital pH meter. \(^12\)

**Viscosity**

Viscosity of the formulated cream was determined using Brookfield viscometer spindle # 7 at 25°C. The dial reading was multiplied by the factor mentioned. \(^13\)

**Spreadability**

500 mg of the cream was sandwiched between two slides. A weight of 100 g was applied on the upper slide. The weight was removed and extra formulation was scrapped off. The lower slide was fixed on board of apparatus and upper slide was fixed with non flexible string on which 20 g load was applied. Time taken by the upper slide to slip off was noted down. \(^14\)

**Spreadability**

Spreadability = \(m \times l / t\),

\(m\) = weight tied on upper slide, \(l\) = length of glass and \(t\) = time in seconds

**After feel**

After application of fixed amount of cream emmoliency and greasiness was checked

**In vitro Drug Release**

The dissolution study were performed in six station dissolution apparatus (37 ± 0.5°C, 50 rpm) using USP paddle type method in phosphate buffer solution (pH 6.8, 900 ml) for next 24 h. The sample of 5 ml each was withdrawn at predetermined time interval and replenished immediately with the same volume of phosphate buffer maintaining sink condition throughout the experiment. The aliquots were analyzed spectrophotometrically at 225 nm. The concentration of drug in test samples was calculated using regression equation. \(^14\)

Page 349
Release Kinetics
The cumulative drug release obtained from the formulation was used to obtain release kinetics i.e. Zero order, First order, Higuchi square root of time plot and Koysmear-peppas power law model. 14, 15

Skin Irritation Study
The irritation study was performed over the skin of albino rats. 1 g of cream was applied on left ear of the albino rat and right ear was considered as control. The development of erythema and oedema was observed for 3 days according to the reported method. 16, 17

Antibacterial Property
Disc diffusion technique was selected for anti microbial study. The test was carried out using Propionibacterium acne Sabouraud-dextrose agar media. An amount of 15 ml of the media with 24 h subculture of Propionibacterium acne was distributed in each petridish and allowed to solidify. On solidification microbial suspension was spread with the help of sterilized cotton swab on the surface of media. The filter paper disc was prepared with Whatman’s filter paper, which then impregnated with drug Withania somnifera present in anti acne cream and control (extract of Withania somnifera) on to the surface of agar plates on which culture of microorganisms has been streaked. Zone of inhibition diameter was then recorded for test and control (280C after 24h) and compared. The study was carried out in aseptic area.

* NMT= not more than, **NLT= not less than

As shown in the table above, physicochemical properties of the drug were calculated. It was found to be in accordance with the standard values of the Hamdard Monograph.

Evaluation of Cream
pH
pH of the formulation was found to be 6.9 ± 0.5.

Viscosity
Viscosity of the formulation was measured after 24 h of the formulation and was found to be 33.5 ± 0.3 cps.

Spreadability
Spreadability of the cream was found to be 40.8 ± 0.5 g/sec.

After Feel Effect
Cream was found to be of emollient nature and non greasy.

UV Spectroscopy

Figure 1: Calibration plot of Withania somnifera in Phosphate buffer pH 6-8

Fourier Transform Infrared Spectroscopy Study

Figure 2: FTIR spectrum of Withania somnifera

Interpretation of FT-IR
The FT-IR analysis of the samples was done and the functional groups associated were determined (Figure 2). The FT-IR spectrum of the Withania somnifera samples recorded the number of peaks lying between 2990 cm⁻¹ – 2500 cm⁻¹, 1700 cm⁻¹ – 1440 cm⁻¹, 1243 cm⁻¹ – 1019 cm⁻¹, 862 cm⁻¹ - 517.19 cm⁻¹ which corresponds with the standard value.

Differential Scanning Calorimetry (DSC)

Figure 3: DSC curve of withanolide

The melting point of extract was found to be 247.633°C which is found to be in accordance with the melting point of withanolide i.e. 245°C – 249°C. This shows that withanolide is present in the extract of Withania somnifera.

% CPDR: Cumulative Percentage Drug Release

Drug release from F1, F2 and F3 shows that F1 has maximum drug release of 72.1% as compared to F2 and F3 which has drug release of 55% and 54% respectively. So the optimized formulation F1 shows highest drug release obtained on the basis of release is F1.

In vitro Drug Release Kinetics

Interpretation of Release Model (In vitro)
The optimized formulation F1 follows first order release kinetics ($r^2 = 0.967$) i.e. drug is being released through the diffusion process. The formulation follows Fickian diffusion (n = 0.404, as obtained from Korsmeyer – peppas law equation)

Skin Irritancy Study

B: final skin irritation scores of anti acne cream AC1 (*** = total of A and B from part A and ** = average of all skin reading from 24 and 72 h)
There is no conflict of interest among the authors regarding the study.

Facility Jamia Hamdard, New Delhi, India

Srivastava Aparajita

Authors are thankful to the principal KIET school of Pharmacy, Ghaaziabad, India for providing the best research facilities available for conducting the research work. Authors are also thankful for the support provided by Hamdard (WAKF) Laboratories, Ghaaziabad, India Central Instrumentation Facility Jamia Hamdard, New Delhi, India for carrying out research activity. There is no any conflict of interest among the authors regarding the submission of manuscript.

ACKNOWLEDGEMENT

The test was performed to confirm the safety of the cream. It is mentioned that score between 0 and 2 indicates that formulation is non irritant and safe for human skin. The mean value of skin irritancy was found to be 1.5. This indicates that excipients used in the formulation are safe and are non irritant for the human skin and can be used for topical delivery.

Anti acne Property of Cream

Anti acne property of cream was evaluated using disc diffusion technique. Zone of Inhibition values for the test and control were observed. The observed average ± SD values for test and control at 500 ppm/disc are 25.66 ± 1.12 and 5.89 ± 1.18, at 250 ppm/disc is 22.34 ± 1.03 and 5.59 ± 0.05 respectively. It was found that test has significantly large zone of inhibition compared to control. Thus, it possess better anti acne property.

CONCLUSION

Anti acne cream was formulated using Withania somnifera extract known for its anti-inflammatory and antioxidant property. Three formulations were prepared and were optimized on the basis of in-vitro release study. Drug was standardized on the basis of different parameters such as UV spectroscopy, FTIR and DSC study. The optimized formulation was evaluated on the basis of skin irritancy test, after feel and anti acne property. Thus the result shows that above formulation can be used effectively for the treatment of acne vulgaris.
